Genes with similarity to proteins in the databases are described
'putative', '-like' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'.
The software programs used to predict genes include: Grail

This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum. Saccharomyces extrazzii, zygosaccharomyces arouxii, Saccharomyces servazzii, zygosaccharomyces rouxii, Saccharomyces kluyverii, Kluyveromyces thermotolerans, Kluyveromyces angusta, var. marxianus, Pichia angusta, Debaryones hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37108-T37313. plants 1 TGAACATTCTCGAACATGCCCGAATATCGCCCCCTCGGGCACCATCGCCATCGCTCGT CTAACACTGATGGTTCGGGTTTTAATAAAAACCCAGAAATAAAACACGTTGAAGGTGATT CTCGAAAATGTGAAAACTTTTATCCACTTGTACCTTCATTGGGAAATGCAATCAAATTAT tgaaagggtggacttcgattattcaatctggtgtagatcggtctttttaacgaaaggat ATACAAGGCTCGAAAGTTTTTATAAACCTTCGAGCCTTGTTGGTCCCACTGATAAAGTTC AATCTTTATCGGTCACTCTTCAACATTTTTTCCCGTTTGCTAGTAATTTGATTGTATTTC TATCACTAGGAATGACGAATCATCATAGCCTTGGTGACGCTAGCACGCGGTTCAACTTTT TGAAAGGGTGGACTTCGATTATTCAATCTGGTGTAGATCGGTCTTTTTAACGAAAGGAT CTCCACCGGTTTTTGATAGATTGATTAACATCCCACATTTAGATGAAATAAGTTGAGAC ö Length 1508; coding for aromatic acyl transferase - for transforming the produce anthocyanin pigments and thus altering colour of flowers Ξ Indels Mizutani BP; 442 A; 294 C; 295 G; 477 T; 0 other; DB 17; 5, Kusumi T,

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.

with aromatic acry transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313. NOTE: This sequence is supposed to cross reference with the protein described in AAM04727, however there are so many discrepancies between the polypeptide decoded from this sequence and the polypeptide given in the specification and described in AAW04727 that the indexer decided
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plants

                                                                                                                                                                                                                                                                      Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourstions to be produced. Six aspecific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       69                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        114 CTTTTCTTCTATGACTTTCCACATTCTAAATCCCATTTCATGGACACTATTGTTCCCAGG 173

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               114 CTTTTCTTCTATGACTTTCCACATTCTAAATCCCATTTCATGGACACTATTGTTCCAGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       114 CTTTTCTTCTATGACTTTCCACATTCTAAATCCCATTTCATGGACACTATTGTTCCCAGG 173

                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                    Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                           The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                713

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids containing electron-transfer group, useful as labels i
hybridization assays, e.g. for genotyping, allowing repeat analyses

The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    GCTCGGGTATATCACTAGGAATGACGAATCATCATAGCCTTGGTGACGCTAGCACGCGGT

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                     ; Search time 168.74 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description
